- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

Answer:

The program is made to manage a list of incident tickets. The program lets the user add incident tickets show the list of incident tickets find particular incident tickets and delete incident tickets. The program also counts how many active incident tickets are, in the list.

- II. **Program Operations:** Briefly explain how your program performs each operation. (Insert Specific Code Line and Your Explanation)

Add Incident:

```
tickets.append([input("Incident ID: "),  
input("Bot: "), input("Description: ")])  
elif choice == "2":
```

This code asks the user to enter the Incident ID, Bot and Description then uses append() to add the incident to the tickets list. The program asks for an Incident ID. Check every ticket in the list. If the ID is the same the program shows the incident. Stops looking by using break.

Display Incidents:

```
for t in tickets:  
    print(t[0], "|", t[1], "|", t[2])
```

This loop goes through every ticket in the list. Shows its Incident ID, Bot and Description.

Search Incident:

```
id = input("Incident ID: ")  
for t in tickets:  
    if t[0] == id:  
        print("Found:", t[0], "|", t[1], "|", t[2])  
        break
```

The program asks for an Incident ID. Check every ticket in the list. If the ID is the same the program shows the incident. Stops looking by using break.

College of Computer Studies

Remove Resolved Incident:

```
for i in range(len(tickets)):
    if tickets[i][0] == id:
        tickets.pop(i)
        print("Removed.")
        break
```

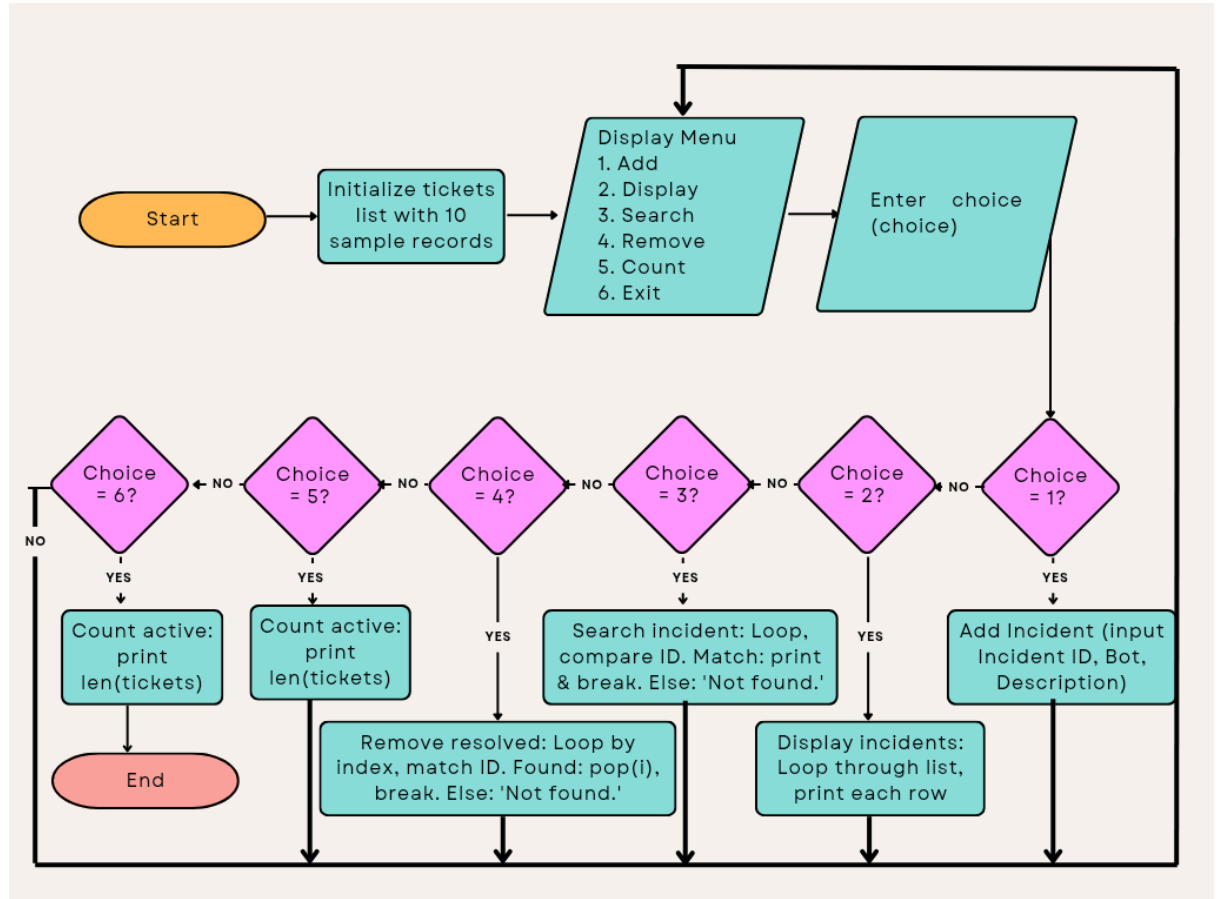

The program checks every ticket for the given Incident ID. When it finds a match, pop(i) takes that ticket out of the list.

Count Active Incidents:

```
print("Active tickets:", len(tickets))
```

The len() function counts how many tickets are currently in the list and shows that, as the number of tickets.

III. **Flowchart:** Create a flowchart showing the overall process and logic of your program.

- IV. **Conclusion:** Briefly explain what you learned from the activity and how the linear data structure was applied.

I learned how to use a data structure to store and manage incident tickets. The tickets list lets the program add, display, find, delete and count incidents. By using lists, loops, append() pop() and len() I learned how to handle data in a program.
